### **DETAILED ACTION**

1. Claims 1-22 are presented for examination.

#### ***Drawings***

2. The corrected or substitute drawings were received on April 08, 2003. These drawings are acceptable.
3. This application, filed under former 37 CFR 1.60, lacks formal drawings. The informal drawings filed in this application are acceptable for examination purposes. When the application is allowed, applicant will be required to submit new formal drawings. In unusual circumstances, the formal drawings from the abandoned parent application may be transferred by the grant of a petition under 37 CFR 1.182.

#### ***Response to Arguments***

4. Applicant's arguments with respect to claims 1-22 have been considered but are moot in view of the new ground(s) of rejection.

#### ***Claim Rejections - 35 USC § 102***

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1-22 are rejected under 35 U.S.C. 102(b) as being anticipated by Abedifard (U.S. Patent No. 6,366,524).

Regarding claims 1, 4, 19 Abedifard discloses a memory device (Figure 1) comprising:

an array of memory cells (102) arranged in a plurality of addressable banks (Column 4, lines 61-62), each bank comprises addressable rows and columns of memory cell (ABSTRACT); a mode register (134) ; and an address circuitry (112) coupled to the mode register to configure the addressable banks in response to a program state of the mode register (Column 4, lines 61-67, Column 5, lines 1-25). More specifically, Abedifard discloses the addressable banks can be configured as either four or eight banks (Figure 1, 104, 106, 108, 110) as claim 2 discloses, and the address selectively routes address signal to either a row decoder or a bank decoder in response to the mode register (Figure 1, 12, 2, 8) as claims 3, 7-8 disclose, and the address circuitry comprises column, row, and bank address decoder (figure 1, 114, 116, 120) as claims 5-6 disclose, and the address signal circuitry coupled to a plurality of address signal input connections (Figure 1, 138) , the address signal circuitry routes a selected one of the plurality of address input connections to either the row or bank address decoder in response to data stored in the register mode (Figure 1, 12, 2, 8) as claims 9-11, 19-22 disclose.

Regarding claims 12-18, the apparatus discussed above would perform the method of operating a memory device in claims 12-18.
